The IST MESCAL project

(Management of End-to-end Quality of Service across
the Internet At Large)

November 2002 to April 2005

Project partners

- **Industrial partners:**

- France Telecom R&D (PM)
- Thales Research Ltd (P)
- Algonet SA (P)

- **Academics:**

- UCL (P)
- UniS (P)

- **Equipment vendors:**

- Cisco Systems (sponsorship)
- Alcatel Bell (standardisation)

Project objectives

- Basic objective:

To specify and validate scalable, incremental solutions that will enable the flexible provisioning of inter-domain QoS across the Internet

- Project work plan includes:
 - Specification of business models and functional architecture
 - Specification, development and validation of dynamic service management algorithms
 - Routing protocols enhancements for inter-domain traffic engineering
 - Integration of IPv6 and multicast

Premium IP Cluster Meeting, Florence, 21 November 2002

From TEQUILA to MESCAL

- TEQUILA addressed mainly *intra*-domain QoS
 - SLSs for customer-ISP interactions
 - service and resource (TE) aspects for edge-to-edge QoS across a single domain
 - inter-domain studies were limited to mechanisms for conveying TE information between domains via BGP NLRI extensions
- MESCAL focuses on *inter*-domain QoS
 - customer-ISP and ISP-ISP interactions
 - service and resource (TE) aspects and interactions across multiple ISPs for inter-domain QoS delivery end-to-end across the Internet
- MESCAL builds on TEQUILA results
 - SLS-based QoS definition
 - service and TE architectures, logic, protocols

Premium IP Cluster Meeting, Florence, 21 November 2002

Environment and assumptions

- No “Internet God”
 - No global view of the Internet
 - No ASs of the same (or affiliated) administration to offer global Internet coverage
- IP-based networking
 - Diffserv-capable IP networks
 - Different QoS policies per ISP
- Build-on existing, widely accepted/deployed inter- and intra-AS protocols (e.g. BGP, OSPF)
- Currently, SLAs between customers and ISPs are given *ONLY* within the geographical span of the ISPs...thus...

MESCAL

Premium IP Cluster Meeting, Florence, 21 November 2002

MESCAL principles

- Co-operation is required between ISPs
- Inter-domain QoS delivery is NOT a single optimization problem, but a set of them
- Clear distinction between services and resources
- ISP interactions based on widely accepted information templates and related exchange protocols (for services and resources)

Premium IP Cluster Meeting, Florence, 21 November 2002

MESCAL approach

Each ISP to:

1. Engineer the QoS capabilities

Extending QoS capabilities beyond domain, by peering SLSs with neighboring ISPs

QoS-bindings of ISP QoS capabilities with QoS capabilities of peer ISPs

2. Engineer the network

Inter-domain: To select the 'best' neighbor to route Internet traffic to

Intra-domain: To meet the QoS of the established SLSs with customers and peer ISPs

Driven by market needs and business objectives

Driven by SLS requirements

Premium IP Cluster Meeting, Florence, 21 November 2002

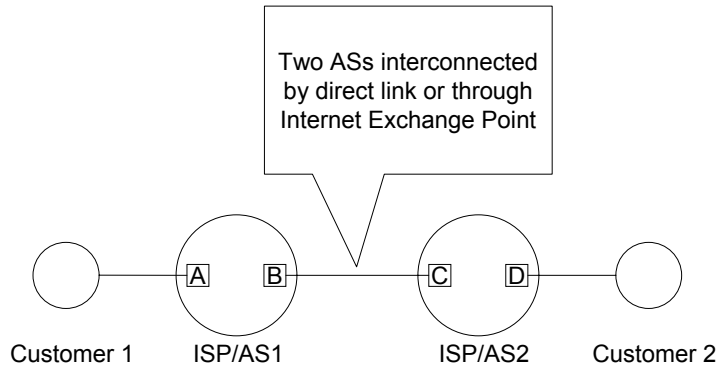

MESCAL vs. TEQUILA revisited

Premium IP Cluster Meeting, Florence, 21 November 2002

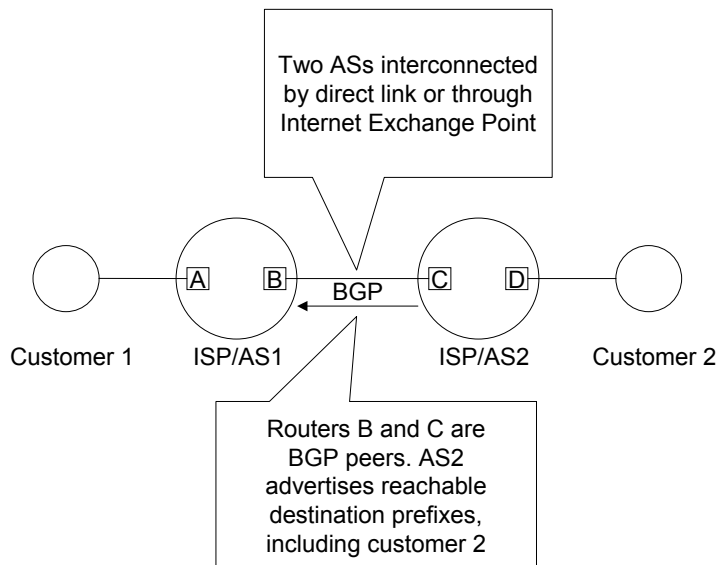

Inter-domain QoS example

Premium IP Cluster Meeting, Florence, 21 November 2002

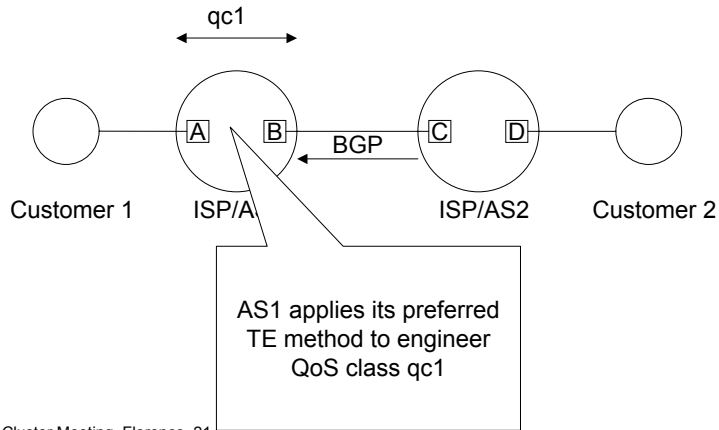

Inter-domain QoS example

Premium IP Cluster Meeting, Florence, 21 November 2002

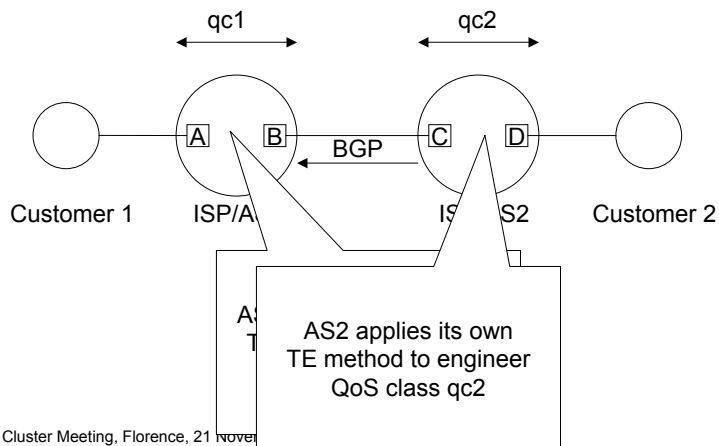

Inter-domain QoS example

Premium IP Cluster Meeting, Florence, 21 November 2002

Inter-domain QoS example

Premium IP Cluster Meeting, Florence, 21 November 2002

Inter-domain QoS example

SLAs are required between ISPs and customers (or peer ISPs) to use other than Best Effort QoS Classes: qc1 or qc2

- quantity of traffic
- topological scope
- quality parameters
- a la TEQUILA SLS template

Inter-domain QoS example

ISP1 is aware of ISP2's qc2 capability through, e.g. InterQoS marketplace.

According to its business objectives, customer requirements, ISP1 defines an *Inter-domain* QoS Class, iqc1:

$iqc1 = qc1 \text{ op } qc2$

(op: e.g. *addition* for delay, *minimum* for throughput)

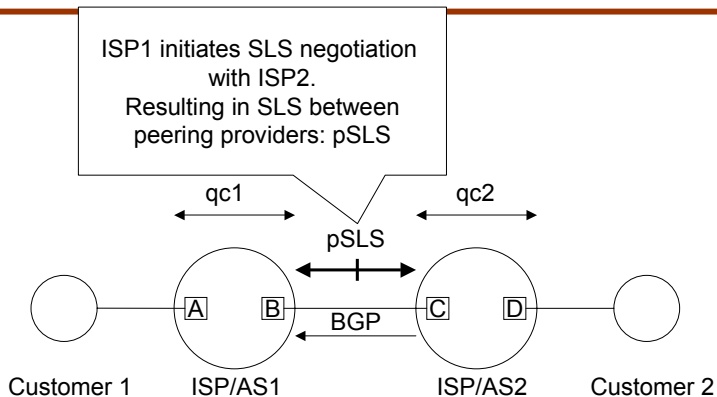

("QoS binding" in MESCAL)

Customer 2

Inter-domain QoS example

Premium IP Cluster Meeting, Florence, 21 November 2002

Inter-domain QoS example

Routers in AS1 are updated with QoS based reachability information
Automatic, distributed configuration to support business agreement (SLS)

ISP2 may reengineer its network
(depending on Resource Provisioning Cycle)
Deploys diffserv traffic conditioner at C

Premium IP Cluster Meeting, Florence, 21 November 2002

Inter-domain QoS example

Routers in AS1 are updated with QoS based reachability information

Automatic, distributed configuration to support business agreement (SLS)

AS2 advertises QoS capabilities to destinations defined in pSLS to AS1.

QoS extensions to BGP4 (qBGP)

reengineer its network in Resource Provisioning Cycle)

serv traffic conditioner at C

Premium IP Cluster Meeting, Florence, 21 November 2002

Inter-domain QoS example

ISP1 is now in a position to offer inter-domain QoS Class *iqc1* to its customers in addition to intra-domain QoS Class *qc1* and BE services

Premium IP Cluster Meeting, Florence, 21 November 2002

Inter-domain QoS example

Customer 1 may now negotiate with ISP1 for a cSLS based on QoS Class iqc1 to customer 2

Premium IP Cluster Meeting, Florence, 21 November 2002

Inter-domain QoS example

ISP1 may reengineer its network to accommodate the new cSLS (depending on its Resource Provisioning Cycle)

Deploys diffserv traffic conditioner at A

Premium IP Cluster Meeting

Inter-domain QoS example

AS1 may now forward packets from customer 1 towards customer 2 via AS2 meeting QoS requirements of cSLS with customer 1 (must assume AS2 fulfils its pSLS)

Premium IP Cluster Meeting, Florence, 21 November 2002

Example 2: >2 ASs/ISPs

Premium IP Cluster Meeting, Florence, 21 November 2002

Example 3: alternative QoS bindings

- Considering one way delay only:
- Possible delay values from customer 1 to 2 of:
 - $qc1 + qc2 = 50 + 200 = 250ms$
 - $qc1 + qc2a = 50 + 100 = 150ms$
 - $qc1a + qc2 = 200 + 200 = 400ms$
 - $qc1a + qc2a = 200 + 100 = 300ms$

Example 3: alternative QoS bindings

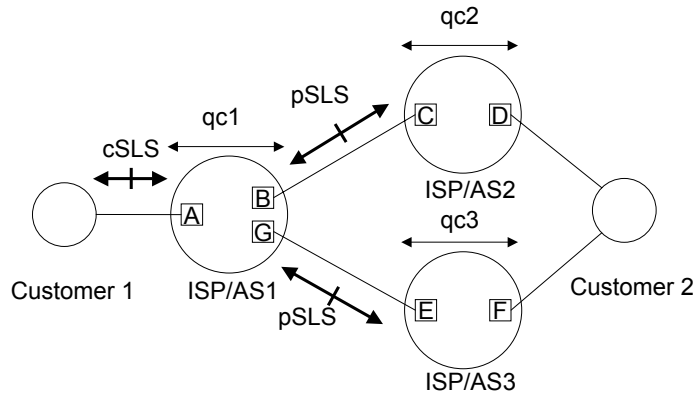

- Considering one way delay only:
- Possible delay values from customer 1 to 2 of:
 - $qc1 + qc2 = 50 + 200 = 250ms$
 - $qc1 + qc2a = 50 + 100 = 150ms$
 - $qc1a + qc2 = 200 + 200 = 400ms$
 - $qc1a + qc2a = 200 + 100 = 300ms$

QoS bindings of:
 {AS1:qc1, AS2:qc2}
 {AS1:qc1a, AS2:qc2a}
 for iqc1 meet max. delay
 of 300ms
 {AS1:qc1, AS2:qc2a} may be
 too expensive...

Example 4: alternative AS paths

Premium IP Cluster Meeting, Florence, 21 November 2002

MESCAL standardisation objectives

- MESCAL proposes to contribute to standardisation in the following areas
 - SLS Management
 - nsis (next steps in signalling)
 - Traffic Engineering
 - ptomaine (prefix taxonomy ongoing measurement & inter network experiment)
 - idr (inter-domain routing)
 - tewg (internet traffic engineering)
 - Policy Management
 - rap (resource allocation protocol)
